

Laboratory 8: AI Tool Exploration and Prompt Engineering

Using Consensus AI

Consensus is an AI academic search engine for peer-reviewed literature,

Initial Prompt

AI Improved Prompt (Using Chatgpt)

Conclusions

Initial Prompt

Conclusion

Across college settings, masculinity is actively “performed” where others can see it, especially in public or highly visible social contexts like doors, sports, male-dominated fields, fraternities, and help-seeking situations. While research rarely labels these explicitly as “public vs. private,” it consistently shows that local norms, audience, and institutional climate shape how strongly students conform to masculine ideals and with what psychological and interpersonal costs.

Context / Subgroup	Masculine conformit link
Sport-involved students	Dominance, risk-takin violence
Fraternity men / heavy sports media users	Control over women, “playboy” norms

AI Improved Prompt (Using Chatgpt)

Conclusion

Across experiments, field observations, surveys, and qualitative work, masculine norm conformity among college-aged men emerges as **highly context-sensitive**: it intensifies in public, socially visible, and evaluative settings, especially with peers or female audiences. Specific masculine norms (e.g., self-reliance, dominance, risk-taking) relate to mental health, sexual attitudes, and bystander behavior, while institutional cultures and media further shape how young men publicly “do” masculinity.

Context / Setting	Main Effect on Masculine-Conformi Behavior
Café exits, gendered door signs	Men follow gender-labeled door more the women
Friendly female audience	Increases men’s risky decision-making
Online groups, public responses	Public + discussion → highest conformity
Public research university	Higher masculine nor conformity in engineering students

Differences within the results

The initial prompt offers a more simplified overview of the subject matter making definitive statements which may be cited by literature however offers little specifics due to lower studies found eligible, also it focused on just two subgroups: Sports involved students and Fraternity Men.

Meanwhile the AI Improved Prompt showed specific contexts within relevant studies offering vastly different but comprehensive results saying that masculine norms conformity is highly dependent on the context men find themselves in showing context settings such as: Cafes, Online and with a female audience. It states that norm conformity is highly influenced by culture and that most studies focus on Western masculine norms but noting that there have been stereotypical traits found world wide.

The difference between the initial and AI improved prompts mostly showed with the specificity of the information, the until gave a more general view of the subject while the AI improved prompts gave a more specified view valuing specific scenarios and context.
